## RA-57 Quick-Loc

The QUICK-LOC system is a revolutionary design that works on the principal of "keep it simple." To date, the only external metallic anchoring for ceramic anchors has been either Ice Tongs or C-Clips. Ice Tongs are limited to overhead applications and C-Clips are expensive and slow to install. Ceramic anchor failures involving C-Clips can result from sharp edge contact between the sheared metal on the C-Clip, and the head of the ceramic anchor. The problem can be compounded due to inconsistencies in contact points resulting in uneven load distribution.

Consider the following advantages of the Quick-Loc:

1. The bottom-line/cost savings
2. Less welding than C-Clips
3. Easier down hand welds
4. No wedge required when mounted flush against the casing
5. Only one wedge is needed for a back-up lining
6. No sharp edges at brick contact point
7. Radius against radius fit
8. Allowance for expansion in all directions
9. Vibrate castables without the wedges falling out
10. Stable enough to form against
11. Consistent depth

Custom made for each ceramic anchor design.
